## MOUNTING INFORMATION

Mount the front vertical disk to the front of the chisel shank as shown on Page 2. Insert the top mount bolt (88410) to position the disc hub. Insert the lower bolt (88940) through the hub, shank and support plate, loosely secure with the heavy nut (88346). Position the U-bolt over the hub as shown and through the support plate, secure with the lock nuts (88661). Once hub is positioned, tighten the hub bolts, followed by the U-bolt nuts.

Secure the rear mount hub as shown. These hubs are for use on shanks where a tire or other interference precludes the use of the front mount cutters. Mount the appropriate cutter blades to the hubs and secure.

After 3-4 hours of use re-torque all mounting hardware and occasionally during extended use.

## Hub Assembly Information

Insert the inner bearing bushing into the hub, bearings need to be press fit into the hub (PRESS BEARING ON BOTH THE INNER HUB AND OUTER RACE WHEN ASSEMBLING) from each side. Make certain the inner races of the bearings are tight against the inner bearing bushing. Once bearings are tight in the hub, insert the cutter pin into the disc blade hub, stack the machinery bushing on the pin, align and insert into the square bore bearing. Place opposite machinery bushing on the pin, assemble the disc hub and secure with the slotted nut.

Torque the nut to a minimum of 500 ft. lbs. Align a slot in the nut to the closest cross hole in the cutter pin and drive in spring pin.

Maintenance of the individual hubs should be minimal, the bearings are greaseless and need no lubrication. Maintain the tightness of the hardware that secures the hub to the chisel plow shank.
